

Supplementary Figure Legends

Figure S1. The expression of EZH2 in HCC tissue microarray.

Representative graph to evaluate of EZH2 protein levels by immunohistochemistry using the H-score.

Figure S2. Knockdown of EZH2 upregulates PD-L1 expression induced by IFN γ at different time points.

Hep3B cells were transfected with NC or different *EZH2*-targeted siRNAs for 48 h, and then treated with IFN γ for the indicated times. FACS staining of PD-L1 was then performed.

Figure S3. EZH2 inhibitors promote the IFN γ -induced PD-L1 expression.

Huh7 or Hep3B cells were treated with concentration gradients of **a** GSK126 (0.05, 0.2, 0.5, 2, and 5 μ M) or **b** DZNep (0.2, 0.5, 2, 5, and 10 μ M) for 72 h, DMSO was used as control. Immunoblotting was performed to detect the levels of EZH2 and H3K27me3. GAPDH and H3 were used as loading controls for EZH2 and H3K27me3, respectively. **c** Huh7 and **d** PLC/PRF/5 cells were pretreated with GSK126, DZNep, or DMSO for 48 h, and then treated with IFN γ for an additional 24 h. Immunoblotting was performed to detect the levels of PD-L1 and H3K27me3. GAPDH and H3 were used as loading controls for EZH2 and H3K27me3, respectively. **e** The indicated cells were pretreated with GSK126, DZNep, or DMSO for 48 h, and then treated with IFN γ for an additional 24 h. FACS was performed to detect PD-L1 expression. (Mean \pm S.E.M.; $n = 3$, * $P < 0.05$, ** $P < 0.01$, *** $P < 0.001$, Wilcoxon test).

Figure S4. The IFN γ -STAT1 signaling is not regulated by EZH2.

PLC/PRF/5 **a** or Huh7 **b** cells were transfected with NC or *EZH2*-targeted siRNA for 48 h, and then treated with IFN γ for 24 h. qPCR analysis was performed to detect the mRNA expression of *IFNGR1*, *IFNGR2*, *JAK1*, and *JAK2*, the relative mRNA expression levels were normalized to that of *GAPDH*.

Figure S5. The EZH2/H3K27me3 axis regulates the expression of IRF1.

a Hep3B and **b** PLC/PRF/5 cells were transfected with NC or *EZH2*-targeted siRNA for 72 h, then treatment with IFN γ for indicted time. Immunoblotting was performed to detect the expression of EZH2, IRF1, and PD-L1. GAPDH was used as a loading

control. **c** After transfection with NC or *EZH2* siRNA targeting 3'-UTR, PLC/PRF/5 cells were transfected with the indicated plasmids for 48 h, and then treated with IFN γ for 24 h. Immunoblotting was performed to detect the levels of EZH2, IRF-1 and PD-L1. The corresponding control groups were transfected with NC siRNA or vector plasmids. GAPDH was used as a loading control. pEZH2 and pIRF-1 represent ectopic expression of EZH2 and IRF-1, respectively. **d** After transfection with NC or the indicated siRNA targeting 3'-UTR, PLC/PRF/5 cells were transfected with the indicated plasmids for 48 h, and then treated with IFN γ for 24 h. Immunoblotting was performed to detect the levels of EZH2, IRF-1 and PD-L1. The corresponding control groups were transfected with NC siRNA or vector plasmids. GAPDH was used as a loading control. pIRF-1 represent ectopic expression of IRF-1. **e** PLC/PRF/5 cells were pretreated with GSK126, DZNep, or DMSO for 48 h, and then treated with IFN γ for an additional 12 h. Immunoblotting was performed to detect the levels of IRF1 and H3K27me3. GAPDH and H3 were used as loading controls for EZH2 and H3K27me3, respectively.

Figure S6. Transcriptome profiling and gene ontology biological analysis of immune-suppressed and immune-activated HCC tissues.

a Heatmap showing differentially expressed genes between immune-suppressed and immune-activated HCC tissues. Each group contains 12 samples. **b** Histogram showing the top 15 gene ontology (GO) terms of differentially upregulated genes in immune-activated HCC tissues.

Figure S7. Effect of IL-6 and TNF α on the expression of PD-L1 in hepatoma cells.

a FACS staining of PD-L1 on hepatoma cells after treatment with IL-6, TNF α , or IFN γ . **b** FACS staining of PD-L1 on Hep3B cells when treated with 0–100 ng/ml of TNF α . Hepatoma cells were transfected with NC or *EZH2*-targeted siRNA for 48 h, and then treated with IL-6 **c** or TNF α **d** for 24 h, and FACS staining of PD-L1 was performed, IFN γ -treated cells were used as positive controls. **e** The indicated cells were treated with TNF α or IFN γ , or both, for 24 h, and then immunoblotting analysis was performed to detect the protein level of PD-L1. GAPDH was used as a loading control.

Figure S8. EZH2 did not effect the protein stability of PD-L1.

Huh7 or Hep3B cells were transfected with NC or *EZH2*-targeted siRNA overnight,

transfected with the PD-L1 plasmid for an additional 48 h, and then treated with 20 μ M CHX for 0, 4, 8, or 12 h. Immunoblotting was performed to detect the levels of PD-L1 and EZH2. GAPDH was used as a loading control.
